# 1 Introduction

The goal of this manuscript is showing the asymptotic behavior of the kernel distance when the parameter of the family is estimated from the data (data-driven parameter). Recall first some notation:  $\{k_\lambda : \lambda \in \Lambda\}$  is a family of kernels where  $\Lambda$  is a parameter space to be specified later. For each of the kernels  $k_\lambda$  we will denote by  $\mathcal{H}_{k,\lambda}$  its associated RKHS and the unit ball of such space as  $\mathcal{F}_{k,\lambda}$ . For a given Borel's measure  $S$ , the mean embedding is defined as

$$\mu_S(\cdot) = \int_{\mathcal{X}} k_\lambda(\cdot, y) \, dS(y), \quad (1)$$

where the integral is understood in the Pettis' sense. The interest of mean embedding lays in the following definition property: for every  $f \in \mathcal{H}_{k,\lambda}$ , we have that  $S(f) = \langle f, \mu_S \rangle_{\mathcal{H}_{k,\lambda}}$ , where  $\langle \cdot, \cdot \rangle_{\mathcal{H}_{k,\lambda}}$  denotes the inner product. In terms of the Riesz's representation theorem for Hilbert's spaces, the mean embedding is the dual element of the integral functional induced by  $S$  in  $\mathcal{H}_{k,\lambda}$  (provided integrability assumptions).

In Cárcamo et al. (2024) we used the following set of assumptions.

**(Reg)** *Regularity assumption.*  $\mathcal{X}$  is a separable metric space and each kernel is continuous as a real function of one variable (with the other kept fixed).

**(Dom)** *Dominance assumption.* There exists a constant  $c > 0$  such that  $k_\lambda \ll c k$ , for all  $\lambda \in \Lambda$ . Further,  $k$  is bounded on the diagonal, that is,  $\sup_{x \in \mathcal{X}} (k(x, x)) < \infty$

(CAMBIAR LA CONDICIÓN DE DOMINANCIA. ES EXCESIVA) Separarla también de lo que se impone para la Donskeridad en  $\mathcal{F}_{k,\Lambda}$ , pues ahora mismo están mezcladas.

**(Ide)** *Identifiability assumption.* If  $P \neq Q$ , there exists  $\lambda \in \Lambda$  such that  $\mu_P^\lambda \neq \mu_Q^\lambda$ .

**(Par)** *Continuous parametrization.*  $\Lambda$  is a compact subset of  $\mathbb{R}^k$  (with  $k \in \mathbb{N}$ ) and, for a fixed  $(x, y) \in \mathcal{X} \times \mathcal{X}$ , the function  $\lambda \mapsto k_\lambda(x, y)$  is continuous from  $\Lambda$  to  $\mathbb{R}$  MODIFICAR LA REGULARIDAD PARA INCLUIR LO QUE NECESITAMOS SOBRE DIFERENCIABILIDAD.

**(Sam)** *Sampling scheme.* The sampling scheme is balanced, that is,  $\frac{n}{n+m} \rightarrow \theta$ , with  $\theta \in [0, 1]$ , as  $n, m \rightarrow \infty$ .

Under a small variation of them, we will exploit the following Prof. Cárcamo's idea: if

$$\begin{aligned} \psi(\lambda, P - Q) &= \sup_{f \in \mathcal{F}_{k,\lambda}} ((P - Q)(f)) = \|\mu_P^\lambda - \mu_Q^\lambda\|_{\mathcal{H}_{k,\lambda}} \\ &= \left( \int_{\mathcal{X}} \int_{\mathcal{X}} k_\lambda(x, y) \, d(P - Q)(y) \, d(P - Q)(x) \right)^{1/2}, \end{aligned} \quad (2)$$

we can use the integral expression to compute the derivative explicitly.

$$h^{+, \lambda} = \frac{\mu_P^\lambda - \mu_Q^\lambda}{\|\mu_P^\lambda - \mu_Q^\lambda\|_{\mathcal{H}_{k, \lambda}}}, \quad (3)$$

## 1.1 Preliminaries

- Reproducing Kernel Hilbert Spaces.
- Mean embedding.
- Empirical process.
- U-statistics.

### Generalized mean embedding

Las aplicaciones continuas y prelineales satisfacen la mayoría de propiedades que les pedimos a las medidas de Borel  $\mathcal{MB}_p(\mathcal{X})$  para que haya mean embedding.

**Lemma 1.** *Let us assume that the family of kernels  $\{k_\theta : \theta \in \Lambda\}$  satisfies (Dom). Then, for every  $\lambda \in \Lambda$ ,  $\mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho) \subseteq \mathcal{H}_{k, \lambda}^*$  and  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho)$  verifies  $\|g\|_{\ell^\infty(\mathcal{F}_{k, \lambda})} = \|g\|_{\mathcal{H}_{k, \lambda}^*} = \sqrt{g(g(k_\lambda(\cdot_1, \cdot_2)))}$ .*

*Proof.* The inclusion  $\mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho) \subseteq \mathcal{H}_{k, \lambda}^*$  is given by the fact that for  $f_1, f_2 \in \mathcal{F}_{k, \lambda}$

$$\rho(f_1, f_2)^2 \leq \max_{S \in \{P, Q\}} \left( \int_{\mathcal{X}} k(x, x) \, dS(x) \right) \|f_1 - f_2\|_{\mathcal{H}_{k, \lambda}}^2. \quad (4)$$

The expression  $\|g\|_{\ell^\infty(\mathcal{F}_{k, \lambda})} = \|g\|_{\mathcal{H}_{k, \lambda}^*}$  is a direct consequence of Dudley (2014, Lemma 2.30, p. 88). Now, by Riesz's representation theorem there exists an element in  $\mathcal{H}_{k, \lambda}$ , let's call it  $\mu_g$ , such that  $\|g\|_{\mathcal{H}_{k, \lambda}^*} = g(\mu_g)$ . It can be proved that  $\mu_g(\cdot) = g(k_\lambda(\cdot_1, \cdot))$ .  $\square$

Comentarios varios sobre que  $\mu_g$  es el “mean embedding” de  $g$  y que hacer producto escalar contra  $\mu_g$  es aplicar  $g$  pero que no tenemos interés en esas propiedades en este trabajo.

## 1.2 State of the art: different approaches to parametric families of kernels

- Median.
- Argmax.
- Rayleigh's quotient.

## 1.3 Our contribution

- Asymptotic result for data-driven kernel distance.
- Negative result on median heuristic for Gaussian kernel.
- Our proposal: data-driven corrected estimation (with the true asymptotic distribution).

# 2 Main results

## 2.1 Differentiability results

Previous lemma to make life easier later.

**Lemma 2.** *Resultado sobre la propiedad Lipschitz marginal (extensión del lema de Shapiro).*

*Proof.* □

### Differentiability under the null. Continuity of $\psi$

**Theorem 3.** *Let us assume that the family of kernels  $\{k_\theta : \theta \in \Lambda\}$  satisfies (Dom) and (Par). The mapping  $\psi$  in (2) is Hadamard directionally differentiable at  $(\lambda, 0)$  tangentially to  $\Lambda \times \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k,\Lambda}, \rho)$ . In such a case, the (directional) derivative of  $\psi$  at  $(\lambda, 0)$  is given by*

$$\psi'_{(\lambda,0)}(\zeta, g) = \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda})} = \|g\|_{\mathcal{H}_{k,\lambda}^*}, \quad (5)$$

with  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k,\Lambda}, \rho)$ .

*Proof.* By definition of Hadamard directional differentiability and Lemma 2, given  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k,\Lambda}, \rho)$  and  $\zeta \in \Lambda$  and sequences  $(\zeta_j)_{j \in \mathbb{N}} \in \Lambda^{\mathbb{N}}$  and  $(t_j)_{j \in \mathbb{N}} \in \mathbb{R}^{\mathbb{N}}$  such that  $d_\Lambda(\zeta_j, \zeta) \rightarrow 0$  and  $t_j \searrow 0$  when  $j \rightarrow \infty$  we have to show that

$$\lim_{j \rightarrow \infty} \frac{\psi(\lambda + t_j \zeta_j, t_j g) - \psi(\lambda, 0) - t_j \psi'_{(\lambda,0)}(\zeta, g)}{t_j} = 0. \quad (6)$$

Under the hypothesis of the theorem, note that

$$\frac{\psi(\lambda + t_j \zeta_j, t_j g) - \psi(\lambda, 0) - t_j \psi'_{(\lambda, 0)}(\zeta, g)}{t_j} = \|g\|_{\ell^\infty(\mathcal{F}_{k, \lambda + t_j \zeta_j})} - \|g\|_{\ell^\infty(\mathcal{F}_{k, \lambda})}. \quad (7)$$

Now observe that  $\|g\|_{\ell^\infty(\mathcal{F}_{k, \lambda + t_j \zeta_j})} = \sqrt{g(g(k_{\lambda + t_j \zeta_j}(\cdot_1, \cdot_2)))}$ . By (Dom), (Par) and dominated convergence theorem,  $k_{\lambda + t_j \zeta_j}(\cdot_1, y)$  converges to  $k_\lambda(\cdot_1, y)$  on the metric  $\rho$  for every  $y \in \mathcal{X}$ . Hence, by continuity of  $g$ ,  $g(k_{\lambda + t_j \zeta_j}(\cdot_1, y))$  to  $g(k_\lambda(\cdot_1, y))$  pointwise in  $y \in \mathcal{X}$ .

At this point, it is worth to mention that by (Dom)

$$|g(k_{\lambda + t_j \zeta_j}(\cdot_1, y)) - g(k_\lambda(\cdot_1, y))| \leq 2 \|g\|_{\ell^\infty(\mathcal{F}_{k, \Lambda})} \sqrt{k(y, y)}, \quad (8)$$

so, by dominated convergence theorem the convergence of  $g(k_{\lambda + t_j \zeta_j}(\cdot_1, \cdot_2))$  to  $g(k_\lambda(\cdot_1, \cdot_2))$  is also given in the metric  $\rho$ . Thanks to the continuity of  $g$ , the first part of the proof is ended.  $\square$

### Differentiability under the alternative

**Theorem 4.** *Let us assume that the family of kernels  $\{k_\theta : \theta \in \Lambda\}$  satisfies (Dom), (Ide) and (Par). If  $P, Q \in \mathcal{MB}_p(\mathcal{X})$  such that  $P \neq Q$ , then the mapping  $\psi$  in (2) is Hadamard directionally differentiable at  $(\lambda, P - Q)$  tangentially to  $\Lambda \times \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho)$ , the subset of  $\ell^\infty(\mathcal{F}_{k, \Lambda})$  constituted by bounded, prelinear and continuous functionals with respect to the distance  $\rho$  in (??). In such a case, the (directional) derivative of  $\psi$  at  $(\lambda, P - Q)$  is given by*

$$\begin{aligned} \psi'_{(\lambda, P - Q)}(\zeta, g) &= g(h^{+, \lambda}) \\ &+ \frac{1}{2 \|\mu_{P - Q}^\lambda\|_{\mathcal{H}_{k, \lambda}}} \int_{\mathcal{X}} \int_{\mathcal{X}} \partial_\lambda k_\lambda(x, y)(\zeta) \, d(P - Q)(y) \, d(P - Q)(x), \end{aligned} \quad (9)$$

with  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho)$  and  $\zeta \in \Lambda$ ; where the functions  $h^{+, \lambda}$  are defined in (3).

*Proof.* By definition of Hadamard directional differentiability and Lemma 2, given  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k, \Lambda}, \rho)$  and  $\zeta \in \Lambda$  and sequences  $(\zeta_j)_{j \in \mathbb{N}} \in \Lambda^\mathbb{N}$  and  $(t_j)_{j \in \mathbb{N}} \in \mathbb{R}^\mathbb{N}$  such that  $d_\Lambda(\zeta_j, \zeta) \rightarrow 0$  and  $t_j \searrow 0$  when  $j \rightarrow \infty$  we have to show that

$$\lim_{j \rightarrow \infty} \frac{\psi(\lambda + t_j \zeta_j, P - Q + t_j g) - \psi(\lambda, P - Q) - t_j \psi'_{(\lambda, P - Q)}(\zeta, g)}{t_j} = 0. \quad (10)$$

To begin with, note that

$$\frac{\psi(\lambda + t_j \zeta_j, P - Q + t_j g) - \psi(\lambda, P - Q) - t_j \psi'_{(\lambda, P - Q)}(\zeta, g)}{t_j} = L_1 + L_2 + L_3, \quad (11)$$

where

$$\begin{aligned}
L_1 &= \frac{\sup_{f \in \mathcal{F}_{k,\lambda}} ((P - Q + t_j g)(f)) - \sup_{f \in \mathcal{F}_{k,\lambda}} ((P - Q)(f))}{t_j}, \\
L_2 &= \frac{1}{L_4} \int_{\mathcal{X}} \int_{\mathcal{X}} \frac{k_{\lambda+t_j \zeta_j}(x, y) - k_{\lambda}(x, y)}{t_j} d(P - Q)(y) d(P - Q)(x), \\
L_3 &= \frac{1}{L_4} \left( g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} - \mu_{P-Q}^{\lambda} \right) + \int_{\mathcal{X}} g \left( k_{\lambda+t_j \zeta_j}(\cdot, y) - k_{\lambda}(\cdot, y) \right) d(P - Q)(y) \right. \\
&\quad \left. + t_j \left( \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})}^2 - \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda})}^2 \right) \right), \\
L_4 &= \left( \left\| \mu_{P-Q+t_j g}^{\lambda+t_j \zeta_j} \right\|_{\mathcal{H}_{k,\lambda+t_j \zeta_j}} + \left\| \mu_{P-Q+t_j g}^{\lambda} \right\|_{\mathcal{H}_{k,\lambda}} \right)^{1/2}.
\end{aligned} \tag{12}$$

The convergence of  $L_1$  was proved in Cárcamo et al. (2024, Lemma 4) and the limit is  $g(h^{+,\lambda})$ , where  $h^{+,\lambda}$  was defined in (3). Provided the convergence of  $L_4$ , by (Dom) and (Par),  $L_2$  converges to

$$\frac{1}{2 \left\| \mu_{P-Q}^{\lambda} \right\|_{\mathcal{H}_{k,\lambda}}} \int_{\mathcal{X}} \int_{\mathcal{X}} \partial_{\lambda} k_{\lambda}(x, y)(\zeta) d(P - Q)(y) d(P - Q)(x). \tag{13}$$

Now we continue with  $L_4$ . By definition

$$\begin{aligned}
\left\| \mu_{P-Q+t_j g}^{\lambda+t_j \zeta_j} \right\|_{\mathcal{H}_{k,\lambda+t_j \zeta_j}} &= \left( \int_{\mathcal{X}} \int_{\mathcal{X}} k_{\lambda+t_j \zeta_j}(x, y) d(P - Q)(y) d(P - Q)(x) \right. \\
&\quad + t_j g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} \right) \\
&\quad + t_j \int_{\mathcal{X}} g \left( k_{\lambda+t_j \zeta_j}(\cdot, y) \right) d(P - Q)(y) \\
&\quad \left. + t_j^2 \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})}^2 \right)^{1/2}.
\end{aligned} \tag{14}$$

From top to bottom in (14):

1.  $\int_{\mathcal{X}} \int_{\mathcal{X}} k_{\lambda+t_j \zeta_j}(x, y) d(P - Q)(y) d(P - Q)(x)$  converges to  $\int_{\mathcal{X}} \int_{\mathcal{X}} k_{\lambda}(x, y) d(P - Q)(y) d(P - Q)(x) = \left\| \mu_{P-Q}^{\lambda} \right\|_{\mathcal{H}_{k,\lambda}}^2$  by (Dom), (Par) and Cauchy-Schwarz's inequality and dominated convergence theorem.

2. By  $g \in \mathcal{C}_{\text{bpl}}(\mathcal{F}_{k,\Lambda}, \rho)$

$$\left| g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} \right) \right| \leq \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})} \left\| \mu_{P-Q}^{\lambda} \right\|_{\mathcal{H}_{k,\lambda}}, \tag{15}$$

so by (Dom),

$$\left| g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} \right) \right| \leq \|g\|_{\ell^\infty(\mathcal{F}_{k,\Lambda})} \int_{\mathcal{X}} \sqrt{k(x,x)} \, d(P+Q)(y), \quad (16)$$

and  $t_j g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} \right)$  goes to 0.

3. Analogously,  $|g(k_{\lambda+t_j \zeta_j})| \leq \|g\|_{\ell^\infty(\mathcal{F}_{k,\Lambda})} \sqrt{k(y,y)}$ , so we can conclude that  $t_j \int_{\mathcal{X}} g(k_{\lambda+t_j \zeta_j}(\cdot, y)) \, d(P-Q)(y)$  is also tending to 0.
4. Finally, since  $\|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})} \leq \|g\|_{\ell^\infty(\mathcal{F}_{k,\Lambda})}$ , then  $t_j^2 \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})}$  converges to 0.

In conclusion,  $L_4 \longrightarrow 2 \|\mu_{P-Q}^\lambda\|_{\mathcal{H}_{k,\lambda}}$  when  $j \longrightarrow \infty$ . To end up this proof, we see the convergence of  $L_3$ . Firstly, we tackle  $\int_{\mathcal{X}} g(k_{\lambda+t_j \zeta_j}(\cdot, y) - k_\lambda(\cdot, y)) \, d(P-Q)(y)$ . Pointwise convergence of  $k_{\lambda+t_j \zeta_j}(\cdot, y)$  to  $k_\lambda(\cdot, y)$  is given by (Dom), (Par) and Folland (1999, Theorem 2.27), convergence in metric  $\rho$  is also given. By continuity of  $g$ ,  $g(k_{\lambda+t_j \zeta_j}(\cdot, y) - k_\lambda(\cdot, y))$  is converging to 0 pointwise when  $j \longrightarrow \infty$ . Since this expression is also bounded by the third item of the previous enumeration, by dominated convergence theorem we have the desired limit.

Secondly, convergence  $g \left( \mu_{P-Q}^{\lambda+t_j \zeta_j} - \mu_{P-Q}^\lambda \right)$  to 0 is to be proved. By (Dom), (Par), and definition of mean embedding,  $\mu_{P-Q}^{\lambda+t_j \zeta_j}$  converges to  $\mu_{P-Q}^\lambda$  pointwise. Now, recall that

$$\left| \mu_{P-Q}^{\lambda+t_j \zeta_j}(x) - \mu_{P-Q}^\lambda(x) \right| \leq 2 \sqrt{k(x,x)} \int_{\mathcal{X}} \sqrt{k(y,y)} \, d(P+Q)(y), \quad (17)$$

by (Dom). So, by virtue of dominated convergence theorem, the convergence is also given in the metric  $\rho$ . By continuity of  $g$ , this term is also done.

Finally, for the last term it is enough to observe that  $\left| \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda+t_j \zeta_j})}^2 - \|g\|_{\ell^\infty(\mathcal{F}_{k,\lambda})}^2 \right| \leq 2 \|g\|_{\ell^\infty(\mathcal{F}_{k,\Lambda})}^2$ . Hence,  $L_3$  is converging to 0 and the proof is ended.  $\square$

## 2.2 Statistic results

### Our asymptotic results

Delta method y palante.

## 2.3 Empirical results

## 3 Notas

1. What happens when the estimated parameter goes to 0 or  $\infty$  in the Gaussian kernel? The limit of the estimated parameter should belong to the parameter space (see Theorem 3).
2. What is the new process? Obviously the empirical process is involved in the second argument. But for the first we should have to add assumptions on the parameter estimation (M-estimators, etc).
3. Empirical results, code (C++) and so: having the asymptotic distribution under the alternative, we can detect or explore examples where Gretton's heuristics is not working (interaction between the two terms of the limit, see below).
